

6.)

- I. The discovered use case is "solve sudoku puzzle", since all users will be using the Sudoku Solver (Assignment4.cpp) for one purpose: solving sudoku puzzles! They literally can't even do anything else with the program, so that is basically the only use case. This use case also produced the other actor, the terminal!
- II. The "solve sudoku puzzle" use case allows sudoku player actors to check an inputted board file for possible solutions, outputting to the terminal/console actor what solutions were found, if any.
- III. Outline for "solve sudoku puzzle"
 - A. Create sudoku puzzle text file for program
 - B. Open terminal and run sudoku solver program by executing it in terminal with puzzle text file as argument
 - C. Program outputs possible solutions, if any, and exits
- IV. Detailed description of "solve sudoku puzzle"
 - A. Create sudoku puzzle text file for program
 1. The sudoku player creates formatted puzzle file(s) from their current sudoku board(s), either using a text editor or AI to do so
 2. The sudoku player puts the text file(s) in the same folder as the sudoku solver program
 - B. Open terminal and run sudoku solver program by executing it in terminal with puzzle text file as argument
 1. The sudoku player opens their computer terminal in the current folder
 2. The sudoku player runs the program with their puzzle text file(s) as an argument(s) through the terminal
 - C. Program outputs possible solutions, if any, and exits
 1. The program takes in the puzzles, looking over them for solutions
 2. The program then outputs the conclusion of its search to the terminal
 3. The program then exits
 4. The sudoku player is left with the solutions in the terminal output.
